IN THE SPECIFICATION:

Please amend paragraph number **[0002]** as follows:

[0002] Field of the Invention: The present invention relates in general to integrated circuit (IC) manufacturing and, more specifically, to methods in IC manufacturing processes for identifying and redirecting ~~IC's~~ ICs mis-processed during their manufacture.

Please amend paragraph number **[0003]** as follows:

[0003] State of the Art: As shown in FIG. 1, a typical process 10 for manufacturing very small electronic circuits referred to as "Integrated Circuits" ~~(IC's)~~ (ICs) begins with the ~~IC's~~ ICs being formed or "fabricated" on the surface of a wafer 12 of semiconductor material, such as silicon. Once fabricated, ~~IC's~~ ICs are electronically probed to determine whether they are functional (i.e., "good") or nonfunctional (i.e., "bad"), and a computer then stores an electronic wafer map 14 of the wafer 12 identifying the locations of the good and bad ~~IC's~~ ICs on the wafer 12.

Please amend paragraph number **[0004]** as follows:

[0004] After being probed, ~~IC's~~ ICs are sawed from their wafer 12 into discrete IC dice or "chips" using high-speed precision dicing equipment. IC dice identified as good by their wafer map 14 are then each "picked" by automated equipment from their sawed wafer 12 and "placed" on an epoxy coated bonding site of a lead frame, while IC dice identified as bad are discarded into a scrap bin 16. The epoxy attaching the good IC dice to their lead frames is then allowed to cure, and the attached dice are wire bonded to their lead frames using high speed bonding equipment. At this point in the process 10, the lead frames of IC dice are still connected to other lead frames.

Please amend paragraph number **[0008]** as follows:

[0008] As described in U.S. Patent ~~No.'s~~ Nos. 5,301,143, 5,294,812, and 5,103,166, some methods have been devised to electronically identify IC dice. Such methods take place

"off" the manufacturing line, and involve the use of electrically retrievable identification (ID) codes, such as so-called "fuse ~~ID's,"~~ IDs," programmed into individual IC dice to identify the dice. The programming of a fuse ID typically involves selectively blowing an arrangement of fuses or anti-fuses in an IC die so that when the fuses or anti-fuses are accessed, they output a selected ID code. Unfortunately, none of these methods addresses the problem of identifying and discarding accidentally assembled IC dice "on" a manufacturing line.

Please amend paragraph number [0010] as follows:

[0010]   In one embodiment, the method identifies and redirects ~~IC's~~ ICs that have been mis-processed, such as bad ~~IC's~~ ICs identified at probe that have accidentally been assembled and packaged. The method includes storing data, such as an electronic wafer map, at probe, for example, in association with a unique identification (ID) code, such as a fuse ID, of each of the ~~IC's.~~ ICs. The stored data indicates a process flow within the IC manufacturing process that each of the ~~IC's~~ ICs should undergo. For example, the stored data may indicate that an IC is bad and should be discarded, or that an IC is good and should be assembled and packaged.

Please amend paragraph number [0011] as follows:

[0011]   As described above, on occasion, one or more ~~IC's~~ ICs do not undergo the process flow they should undergo. For example, some bad ~~IC's~~ ICs may proceed through assembly and packaging rather than being discarded. To check for ~~IC's~~ ICs that have not undergone the process flow they should undergo, the present method also includes reading the ID code of each of the ~~IC's~~ ICs at, for example, the opens/shorts test at the end of assembly. The data (e.g., the wafer map) stored in association with the ID code of each of the ~~IC's~~ ICs is then accessed and evaluated to identify any ~~IC's~~ ICs that have undergone a process flow within the IC manufacturing process that is different from the process flow their data indicates they should have undergone, such as bad ~~IC's~~ ICs that have proceeded through assembly and packaging. Any ~~IC's~~ ICs identified as having been mis-processed are then redirected within the IC

manufacturing process. Thus, for example, bad ~~IC's~~ ICs that have been assembled and packaged may be discarded so they do not proceed to back-end testing.

Please amend paragraph number **[0012]** as follows:

[0012] In another embodiment of the present invention, a method of manufacturing IC devices, such as Dynamic Random Access Memory Devices ~~(DRAM's),~~ (DRAMs), from semiconductor wafers includes providing the semiconductor wafers and fabricating ~~IC's~~ ICs on the wafers. A substantially unique ID code, such as a fuse ID, is then stored in each of the ~~IC's,~~ ICs, and data is stored in association with the ID code of each of the ~~IC's~~ ICs that indicates a manufacturing process flow that each of the ~~IC's~~ ICs should undergo. Each IC is then separated from its wafer to form an IC die, and the IC dice are assembled into IC devices, such as wire bond/lead frame devices, Chip On Board (COB) devices, or flip-chip devices. The ID code associated with each of the IC devices is then read, and the data stored in association with the ID code associated with each of the IC devices is accessed and evaluated to identify any IC devices that have undergone a manufacturing process flow that is different from the manufacturing process flow their data indicates they should have undergone. These identified IC devices are then redirected (e.g., discarded), and the remaining IC devices continue on to back-end testing.

Please amend paragraph number **[0013]** as follows:

[0013] A further embodiment of the present invention comprises a method of manufacturing Multi-Chip Modules ~~(MCM's)~~ (MCMs) similar to the method of manufacturing IC devices described above.

Please amend paragraph number **[0014]** as follows:

[0014] A still further embodiment of the present invention comprises another method of manufacturing IC devices from semiconductor wafers. The method includes providing the semiconductor wafers and fabricating ~~IC's~~ ICs on the wafers. Each IC is electronically probed

6

to identify good and bad ~~IC's~~ ICs on the wafers and then programmed with a unique fuse ID. An electronic wafer map is stored for each wafer indicating the locations of good and bad ~~IC's~~ ICs on the wafer and associating each IC on the wafer with its fuse ID. Each IC is then sawed from its wafer to form a discrete IC die that is automatically picked and placed on an epoxy coated bonding site of a lead frame. The epoxy is allowed to cure, and the IC dice are then wire bonded to their respective lead frames. Next, the IC dice and their associated lead frames are injection molded to form IC packages. Projecting leads of the packages are then de-flashed, the packages are cured, and the leads are then electroplated. Then, each package is singulated to form a discrete IC device, and each device is tested for opens and shorts. The fuse ID associated with each IC device is then electrically retrieved so the wafer map stored in association with the fuse ID associated with each of the IC devices may be accessed and evaluated to identify any IC devices that include a bad IC and any IC devices that include a good IC. Any IC devices identified as including a bad IC are discarded, and any IC devices identified as including a good IC proceed to back-end testing.

Please amend paragraph number [0017] as follows:

[0017]   As shown in FIG. 2, an inventive method 20 for manufacturing integrated circuits ~~(IC's)~~ (ICs) from a group of semiconductor wafers 22 includes the step 24 of fabricating the ~~IC's~~ ICs on the wafers 22. It will be understood by those having skill in the field of this invention that the present invention is applicable to any IC devices, including Dynamic Random Access Memory (DRAM) ~~IC's,~~ ICs, Static Random Access Memory (SRAM) ~~IC's,~~ ICs, Synchronous DRAM (SDRAM) ~~IC's,~~ ICs, processor ~~IC's,~~ ICs, Single In-line Memory Modules ~~(SIMM's),~~ (SIMMs), Dual In-line Memory Modules ~~(DIMM's),~~ (DIMMs), and other Multi-Chip Modules ~~(MCM's).~~ (MCMs). It will also be understood that although the present invention will be described below in the context of a wire bond/lead frame assembly process, the present invention is applicable to any IC assembly process, including, for example, Chip On Board (COB), flip chip, and Tape-Automated Bonding (TAB) processes.

Please amend paragraph number **[0018]** as follows:

[0018] After fabrication, the ~~IC's~~ ICs are electronically probed in a probe step 28 to evaluate a variety of their electronic characteristics, and data from the probe step 28 identifying bad and good ~~IC's~~ ICs are noted and stored as wafer maps 30, as described above. During the probe step 28, ~~IC's~~ ICs fabricated on the wafers 22 are programmed in the manner described above with a fuse identification (ID) unique to each IC. The fuse ID for each IC is then stored in association with the wafer maps 30 such that each die location on each wafer map 30 is associated with the unique fuse ID of a particular IC. The fuse ID may identify, for example, a wafer lot ID, the week the ~~IC's~~ ICs were fabricated, a wafer ID, a die location on the wafer, and a fabrication facility ID.

Please amend paragraph number **[0019]** as follows:

[0019] It will be understood, of course, that the present invention includes within its scope ~~IC's~~ ICs having any ID code, including those having fuse ~~ID's~~ IDs. It will also be understood that the ~~IC's~~ ICs may be programmed with their fuse ~~ID's~~ IDs at steps in the manufacturing process of inventive method 20 other than the probe step 28.

Please amend paragraph number **[0020]** as follows:

[0020] Once programmed, the ~~IC's~~ ICs proceed through an assembly process 32 to an opens/shorts test 34 as described above. At the opens/shorts test 34, the fuse ID of each IC is automatically read and correlated with the wafer map 30 of its wafer 22. If a bad IC has accidentally proceeded through the assembly process 32, the fuse ID of the IC, in correlation with the wafer map 30 of the ~~IC's~~ ICs wafer 22, will identify the IC as a bad IC so it can be discarded to a scrap bin 36 instead of proceeding through back-end testing. The present invention thus provides a method of identifying and discarding accidentally assembled ~~IC's~~ ICs before they undergo back-end testing.

8

Please amend paragraph number **[0021]** as follows:

[0021] It should be understood that although the fuse ~~ID's of IC's~~ IDs of ICs in the process ~~of inventive method~~ 20 are typically read electronically, they may also be read optically if the fuse ~~ID's~~ IDs consist of "blown" laser fuses that are optically accessible. It should also be understood that the present invention includes within its scope any method in an IC manufacturing process for identifying and redirecting ~~IC's~~ ICs mis-processed during their manufacture using ID codes such as fuse ~~ID's~~ IDs.
